COVID-19 Global Impact Dashboard

EXECUTIVE SUMMARY · DATA-DRIVEN REPORT

Objective. Compare reported cases, deaths and vaccination coverage across locations and dates using the Our World in Data schema or a compatible uploaded dataset.

Source / coverage. User-provided synthetic demonstration dataset; NOT real COVID statistics; 2021-01-01 to 2022-12-31. 3,650 cleaned observations across 5 locations.

Key indicators (latest observation per location; rates averaged across locations)

Latest reported cases	8,131,825
Latest reported deaths	71,013

Findings

• Highest single-day reported cases in the filtered records: Demeria (10,410) on 2022-02-18.

• Highest single-day reported deaths in the filtered records: Demeria (104) on 2022-02-18.

Cleaning and assumptions. Invalid dates and blank locations are excluded; duplicate location-date rows keep the last record. Negative reported counts and non-positive populations are treated as missing, not zero. Missing values are not imputed. Rates use valid population denominators. Vaccination fields distinguish at-least-one-dose from fully vaccinated coverage.

Limitations / conclusion. Reported outcomes depend on testing, reporting practices, age structure, variants, prior immunity and time lags. Coverage and deaths may be associated without establishing causation; cross-country comparisons are descriptive. Interpret results with these caveats.
